A

Stereo test

In some of the experiments, the subjects were tested for their ability to use stereoscopic information. To test this, they were asked to describe the figures hidden in a random-dot stereogram. Figures A.1 and A.2 give an impression of the two random-dot stereograms that were used. To facilitate viewing, the stereogram was presented via a commercially available stereo viewer bought in a toy store. The stereograms were printed in 300 dpi on a transparent sheet that was the viewed in the stereo viewer.

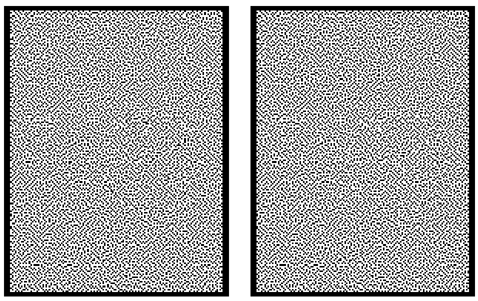

Figure A.1. Random-dot stereogram: pacman. This stereoscopic image can be viewed by looking at the left image with the left eye, and at the right with the right eye.

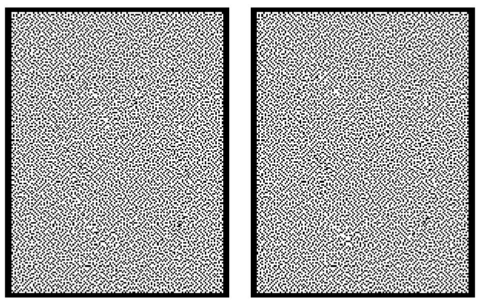

Figure A.2. Random-dot stereogram: rabbit. See Figure A.1.
